Candidate Assignment

EverGPT Library

EverGPT is our internal AI assistant. Employees use it to ask questions, use AI tools, and create useful outputs during chats.

Some outputs such as webpages, reports, or presentations need to remain available after the original conversation ends.

Task

Design a simple Library experience that helps employees find, understand, and act on assets created in past EverGPT conversations.

Assume assets can have different statuses (draft, published etc..), may be created in different chats, and may be shared with colleagues.

Show your proposal in the format that best communicates it: sketches, wireframes, prototype, or a concise written flow.

Please include:

1. The problem you are solving.
2. Your proposed experience.
3. Key assumptions or unanswered questions.
4. What you prioritised and why.
5. How you would measure success.

Timebox

60–90 minutes.

What we assess

- Clear understanding of the user need
- Simple, useful information organisation
- Sensible prioritisation and trade-offs
- Ability to work with incomplete context
- Clear communication

Discussion

After the presentation, we will share the current Library implementation and discuss similarities, differences, and what the candidate would improve.
